

MyDebit Shared ATM Switch Assessment Brief

Organization: Synthetic PayNet Card and ATM Rail Lab

Scenario: MyDebit Shared ATM Switch

Classification: synthetic test evidence only.

Public inspiration: MyDebit and Shared ATM Network material describe domestic debit acceptance and interbank ATM switching infrastructure.

System summary: Synthetic domestic debit and shared ATM switching platform for POS acquiring, ATM withdrawals, issuer routing, token validation, and cash-out controls.

Risk goal: Retail POS and ATM edge exposure with legacy HSM and host-key cryptography.

Key findings: TLS 1.1 ATM gateway compatibility; RSA-2048 acquirer host key; DSA legacy HSM signing profile; ECDH POS terminal session establishment.

Expected scan behavior: POS/acquirer and ATM gateway findings should be high where RSA, DSA, ECDH, and TLS 1.1 are present; token vault AES-256 should remain low risk.

Recommended validation: remove TLS 1.1, replace DSA signing profiles, and define ML-KEM/TLS 1.3 acceptance for new Tap On Phone paths.

No credentials, private keys, payment tokens, PINs, account numbers, customer data, or live infrastructure references are included.
