

RTGS RENTAS Wholesale Settlement

Assessment Brief

Organization: Synthetic Central Settlement Participant Lab

Scenario: RTGS RENTAS Wholesale Settlement

Classification: synthetic test evidence only.

Public inspiration: BNM operational material describes RENTAS as a multi-currency real-time gross settlement system for interbank funds transfer and securities settlement.

System summary: Synthetic wholesale RTGS participant gateway for high-value interbank funds transfer, securities settlement, participant terminal access, SWIFT-style messaging, and recovery-site operations.

Risk goal: Mission-critical wholesale settlement with private network exposure and very high business impact.

Key findings: RSA-2048 participant terminal certificate; ECDSA-P256 SWIFT-style message signing; TLS 1.2 participant bank gateway; ML-DSA target state for settlement authorisation.

Expected scan behavior: Even private participant links should rank high because RSA/ECDSA/TLS 1.2/legacy token controls sit on high-value settlement paths; exposure should be PARTNER or INTERNAL rather than public internet.

Recommended validation: map all participant certificates, signing profiles, recovery-site tokens, and candidate ML-DSA settlement authorisation paths.

No credentials, private keys, payment tokens, PINs, account numbers, customer data, or live infrastructure references are included.
